

REAMS software: This software calculates potential risk, can be used to develop clean-up goals, and includes fate-&-transport models. Please ensure that the most recent [toxicity values](#) are included in REAMS. REAMS software is used to demonstrate RCRA unit closure either for unrestricted future use (residential) or closure with restricted (industrial only) future use, calculating site-specific ACLs, and Permit related risk assessments for combustion facilities. Using REAMS is recommended (but not required) for all other RCRA risk assessments. If a risk assessment is performed without using REAMS, facilities should provide the assumptions in a table. The facility may use tables provided in RAGS part D (<http://www.epa.gov/oswer/riskassessment/ragsd/tables.htm>) to present exposures defaults.

For the purchase of REAMS software and manual, please send a letter requesting REAMS software and a check of \$25.00 made payable to the “Virginia Department of Environmental Quality.” Please mail the letter and the check to the following address:

VADEQ Fiscal Office
P. O. Box 1105
Richmond, VA 23218

Following the receipt of the check, the REAMS software will be mailed by US mail.
