Compost!

the solution to sustainable soil and water

International Compost Awareness Week

May 5 - May 11, 2014

US Composting
Council®

Our goal is to partner with customers that support organics recycling (composting) and who appreciate the environmental impact of sustainable action. We provide effective material handling methods which insure best managed practices through more comprehensive recycling. We target the diversion of organic weight from your existing waste stream and seek to find a balance to offset any additional cost to your waste budget.

Our core concept has two parts. First diversion of these materials from the landfill to a properly permitted composting facility. Secondly, to educate the public and encourage the use of compost and it's many environmentally positive applications.

We return compost for use throughout our community through our Compost Credit Program. Participants receive "compost credits" as an added benefit of partnering with us.

For every ton of compostable material that we record & haul, a credit is issued redeemable for 40 lbs of compost which can be used onsite for landscaping/ gardening. Alternatively, these credits can be donated to a local community garden/ agricultural related charity. This compost is delivered free of charge as part of our services.

Currently, social environmental awareness is growing within our communities as people want to become more proactive with regard to environmental conservation. Our company was formed to provide a solution for managing organic waste/ food scraps. We provide the logistical know how to collect and convert organics into a useful new product that improves and protects our soils and the environment.
