

A photograph of a forest stream. The water is dark and flows over a rocky bank. The surrounding area is filled with dense green trees and foliage. The scene is captured from a slightly elevated perspective, looking down at the stream.

Accotink Creek TMDL Study 4th TAC Meeting

Thursday July 28th, 2016

Today's Agenda

- Status update on
 - Sediment TMDL
 - Chloride TMDL
- Discuss options for setting allocations
- Next Steps

Sediment TMDL

GWLF Calibration Targets

| Sediment Sources | Target or Calculation Method | Source of Data |
|----------------------|--|---|
| Transportation | 122 mg/l, end-of-pipe | Average of Station Average Concentration from National Stormwater Quality Database, EPA Rain Region 2 |
| Other Developed Land | 88 mg/l, end-of-pipe | |
| Open Space | Universal Soil Loss Equation (as calculated by GWLF) | Based on soil data, slopes, GWLF defaults |
| Construction | 1.8 t/ac | Chesapeake Bay Expert Panel Report |
| Point Source | By Permit and Outfall | Permit Discharge Monitoring Reports |
| Streambank Erosion | Calculated by GWLF; adjusted if necessary | Empirical Load Estimates Fairfax County Watershed Management Plan |

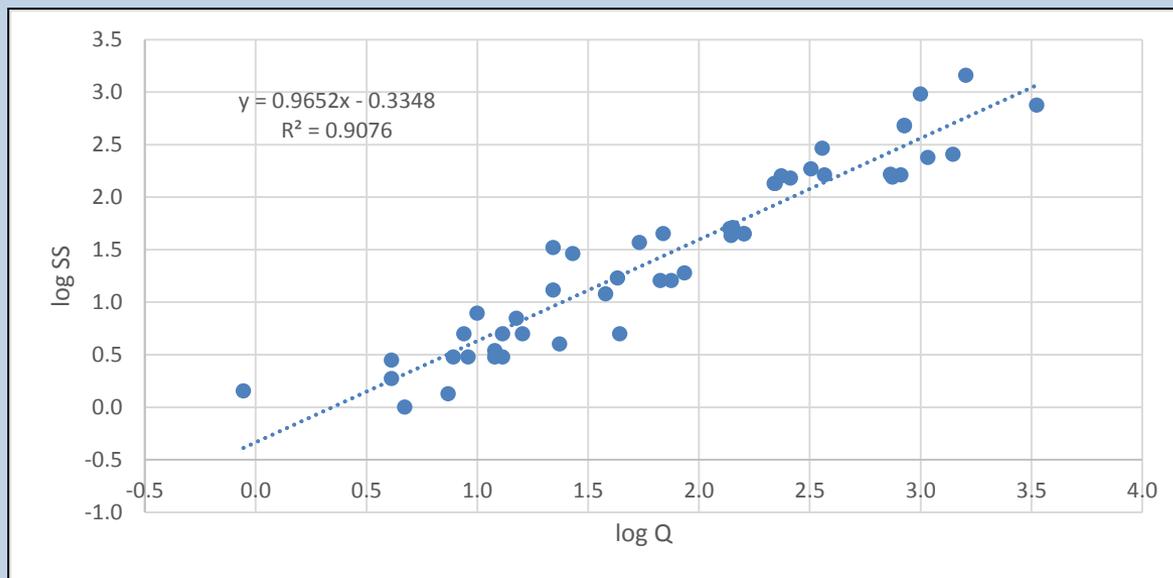

Empirical Sediment Load Estimates for GWLF Verification

- Base empirical load estimates on
 - Suspended sediment grab samples
 - Continuous flow data
 - Continuous turbidity data (Long Branch)
- Compare to GWLF Model output

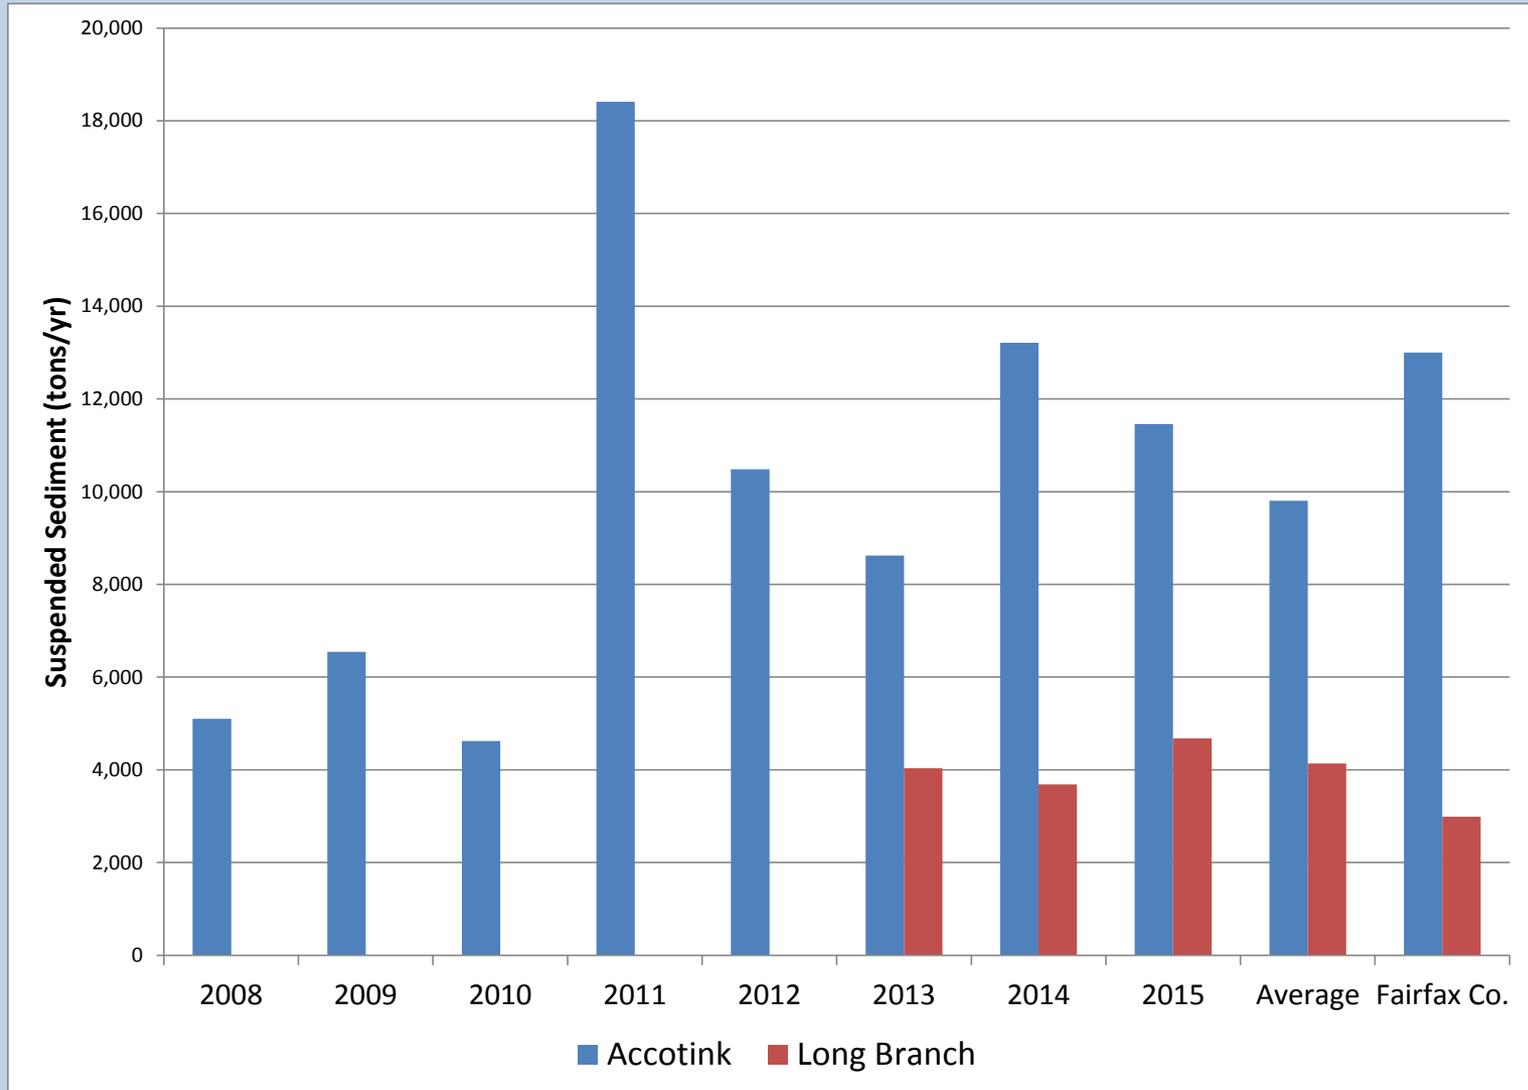

Accotink Creek Regression Models

| Location | Model | R ² | Years Estimated |
|----------------------------------|-------------------------------|----------------|-----------------|
| Long Branch | Log SS ~ Log Q+ Log Turbidity | 0.91 | 2013-2015 |
| Accotink Creek near Braddock Rd. | Log SS ~ Log Q | 0.91 | 2008-2015 |

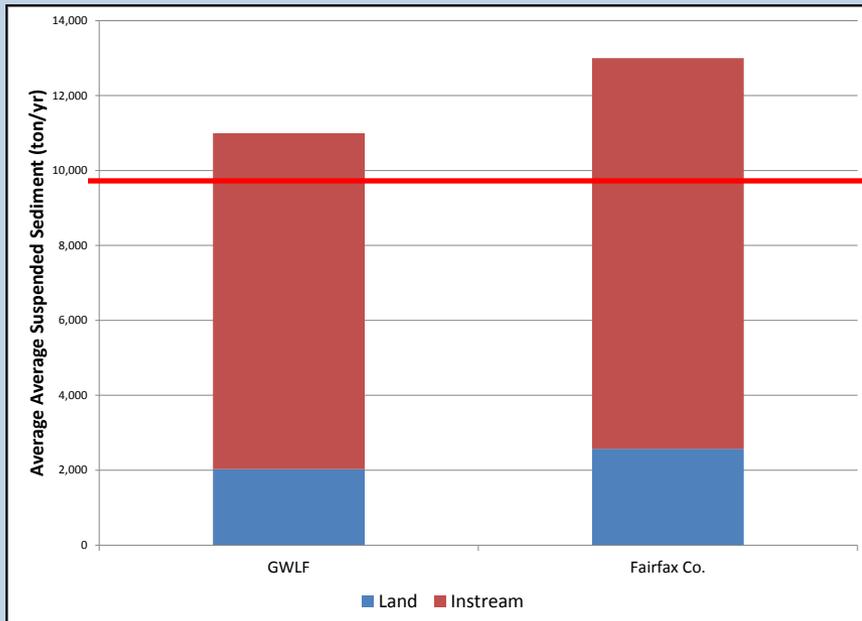

Estimated Annual Sediment Loads

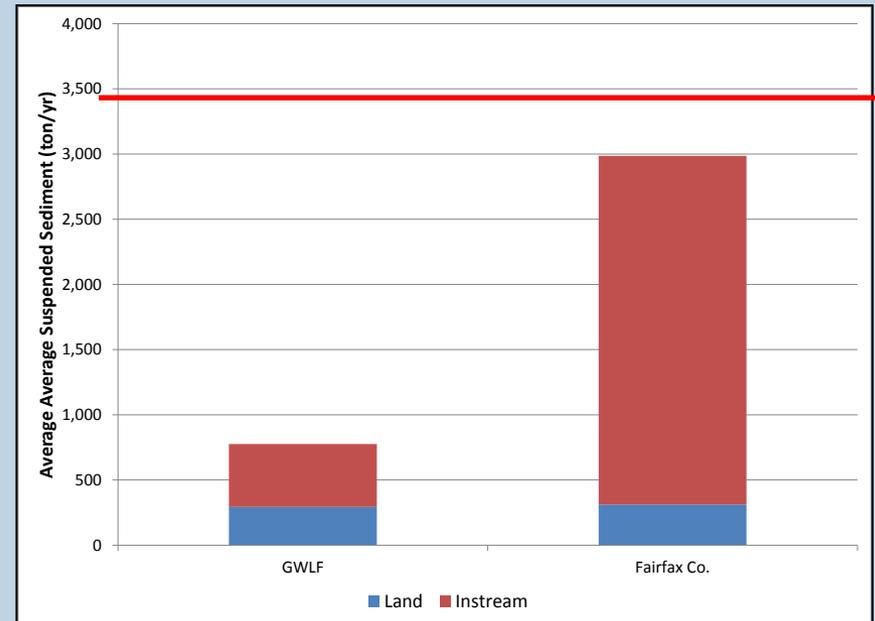

Comparison of GWLF, Fairfax County, and Empirical Load Estimates

Upper Accotink Creek

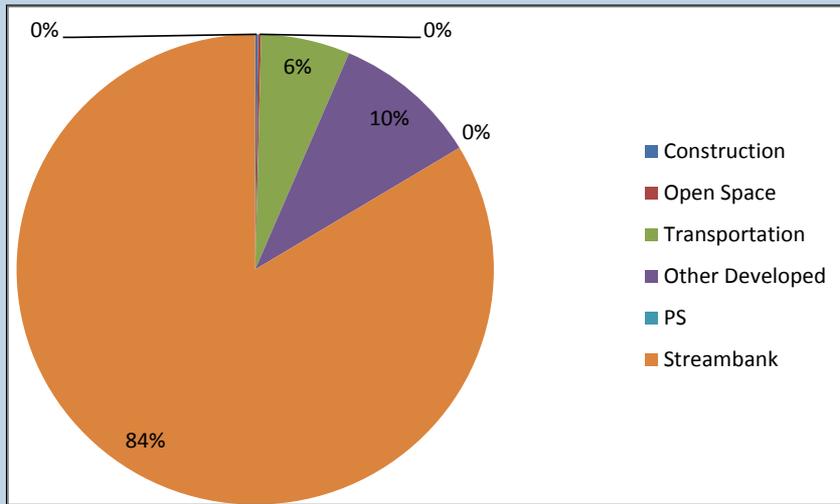

Long Branch

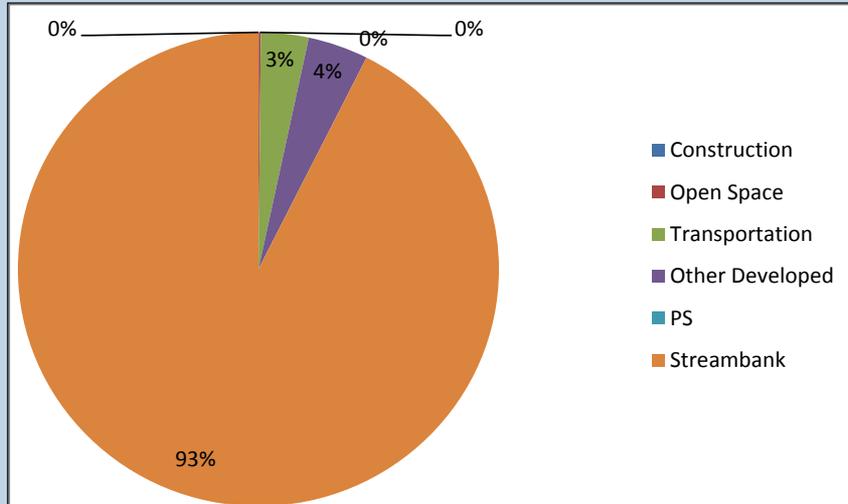

Regression Estimate

Sediment Loads by Source

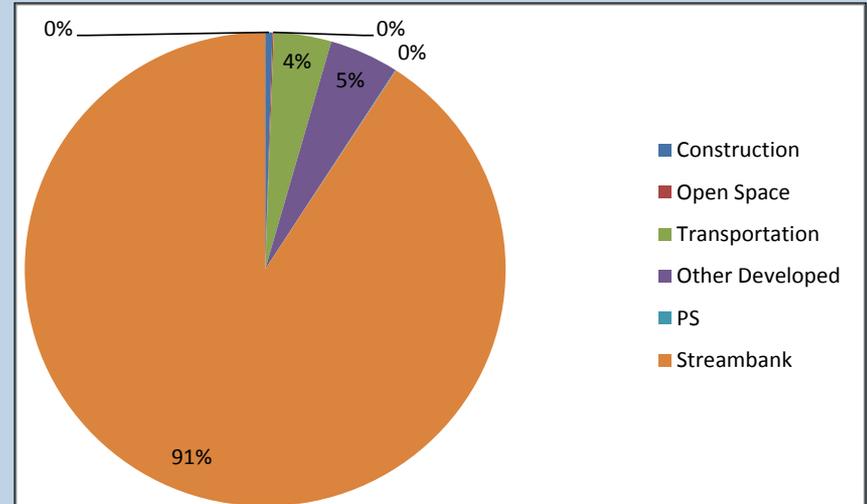

Upper Accotink Creek

Long Branch¹

¹Includes adjustment to match estimated loads.

Lower Accotink Creek²

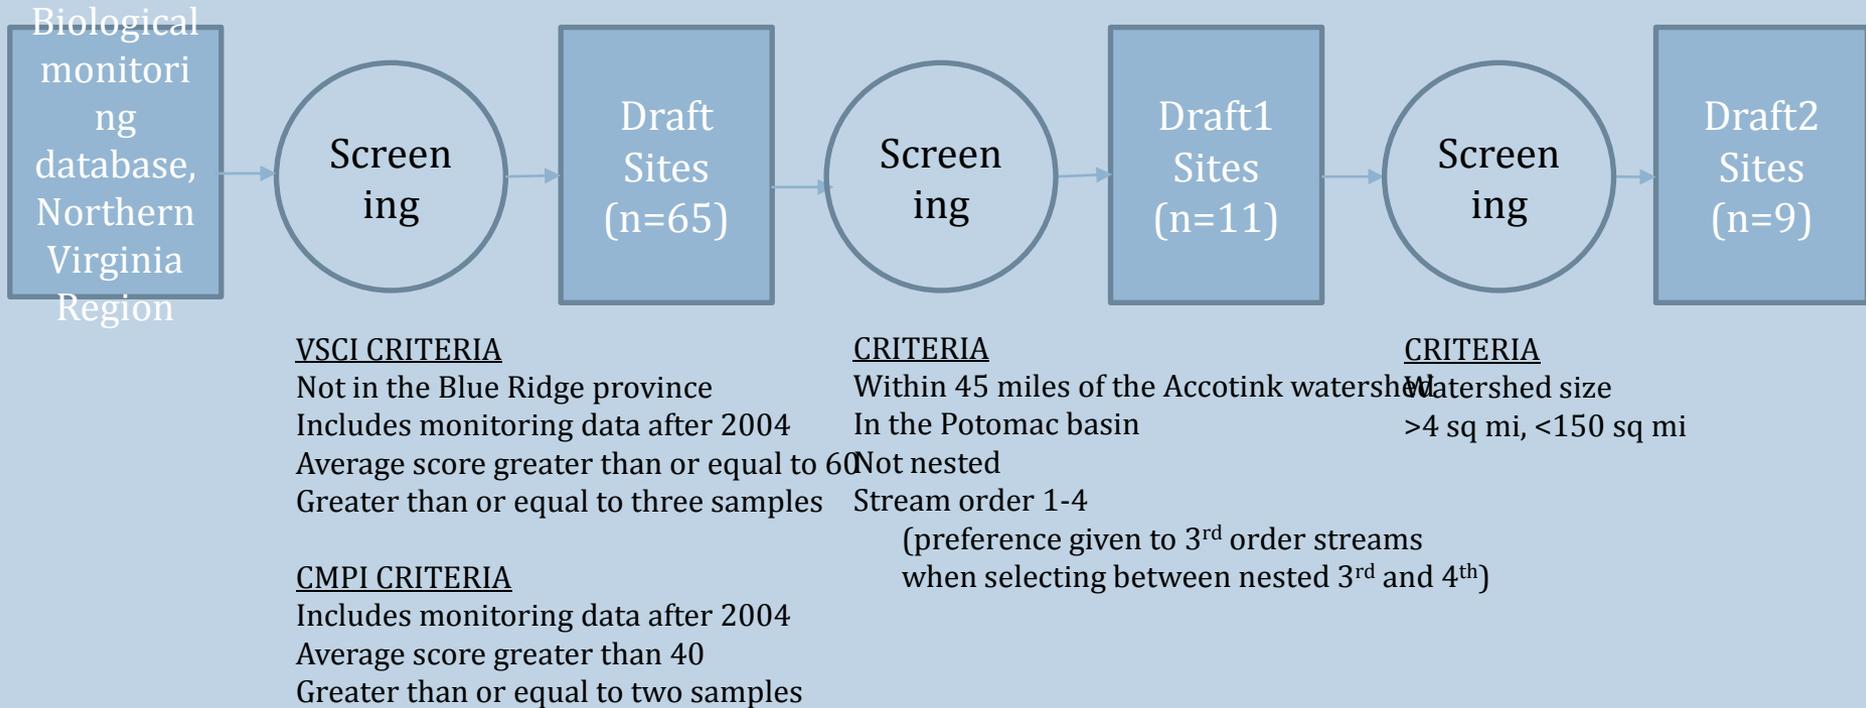

²Includes loads from upper Accotink Creek with 54% reduction due to Lake Accotink.

AllForX Method

- Calculate AllForX for impaired watershed (current conditions) and comparison watersheds
- Regress AllForX values against Virginia Stream Condition Index (VSCI) scores
- Identify AllForX threshold where regression line crosses VSCI impairment threshold (60)
- Sediment TMDL: AllForX threshold (from regression) multiplied by all-forested load from impaired watershed

DRAFT AllForX Comparison Watershed Screening Criteria, Accotink Creek Sediment TMDL

developed based on the AllForX methodology documented in Virginia Tech 2015, Yagow 2014, and Yagow et al. 2013.

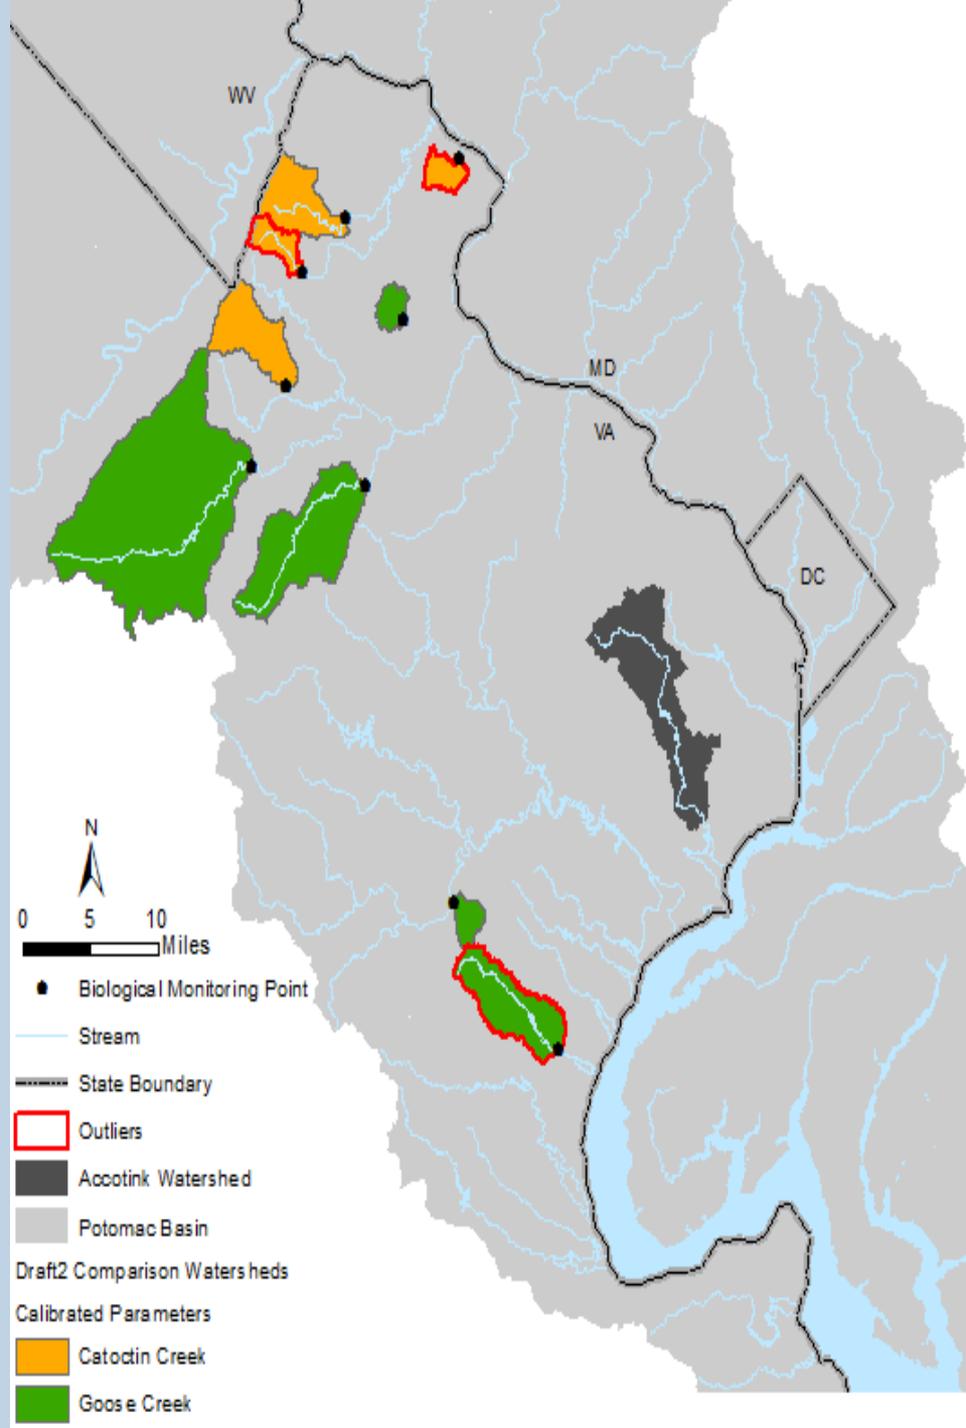

References:

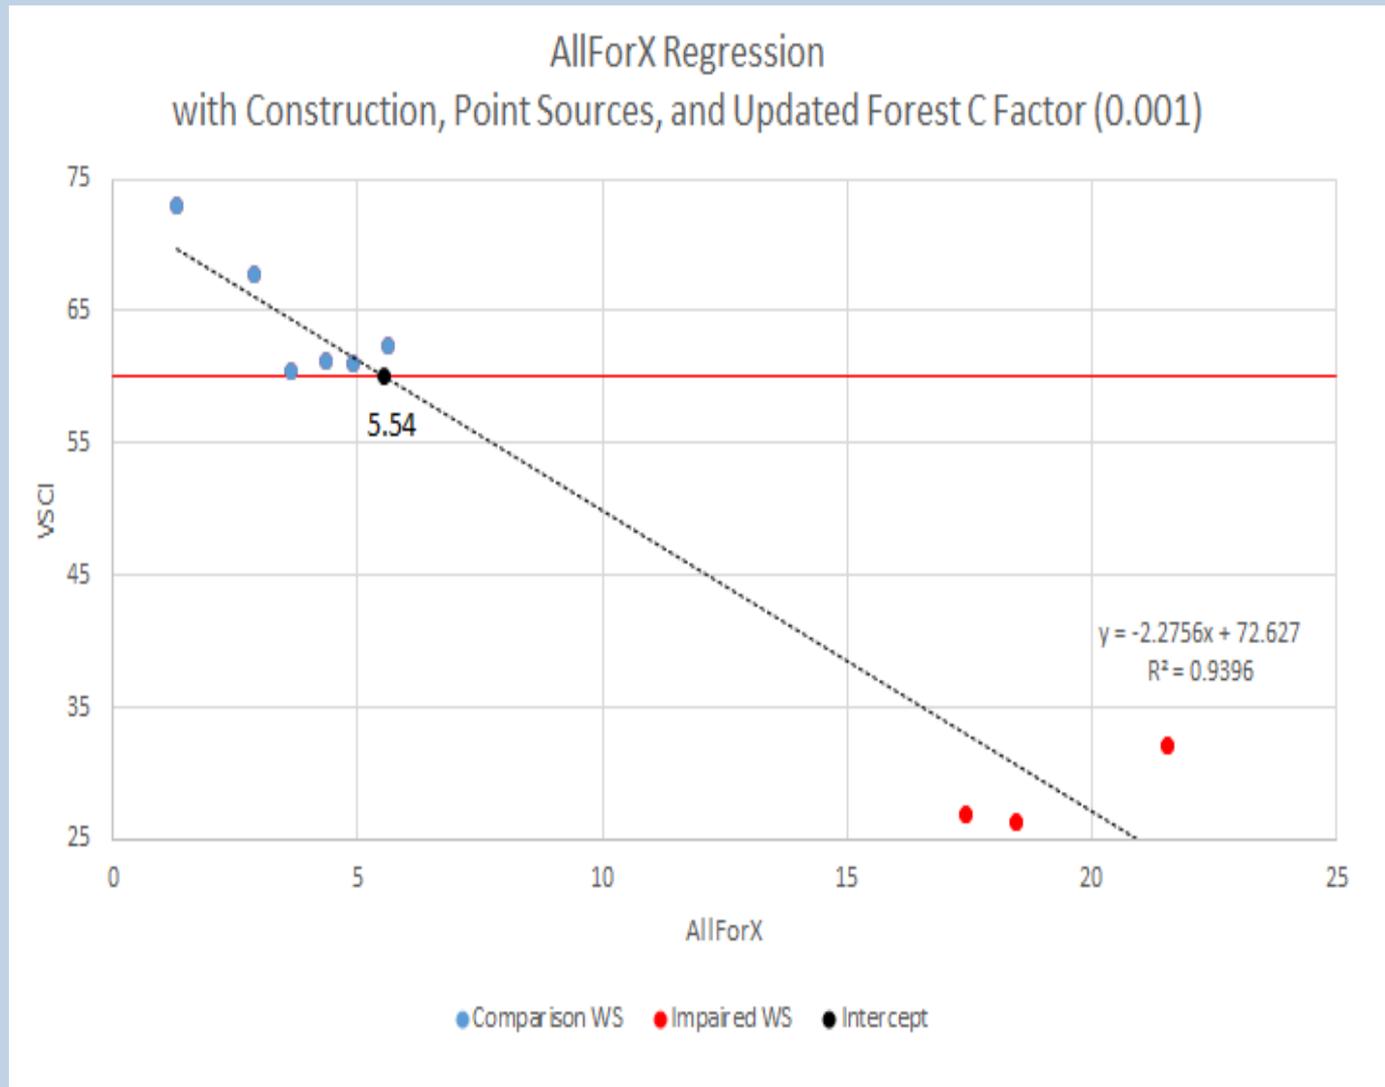

- Virginia Tech. 2015. TMDLs for benthic impairments in Little Otter River (sediment and total phosphorus), Johns Creek, Wells Creek, and Buffalo Creek (sediment). Prepared for VA DEQ. 141p.
- Yagow, G. 2014. Creating data layer for analysis of AllForX comparison watersheds. Memo-to-file dated June 19, 2014.
- Yagow, G., B. Benham, K. Kline, and C.J. Mitchem. 2013. Developing sediment load thresholds protective of aquatic life. 2013 ASABE Annual International Meeting. Kansas City, Missouri. July 21-24.

Model Inputs

- Calibrated parameters from either Goose Creek or Catoctin Creek applied to each watershed
- Observed data
 - BMPs, land use, soil, 6 weather stns, animals, permitted discharges, construction
- MapShed calculated inputs
 - K, LS, sediment A factor, etc.

DRAFT AllForX Regression

Preliminary TMDL Reductions

| Impairment | TMDL Reduction |
|----------------|----------------|
| Upper Accotink | 70% |
| Long Branch | 68% |
| Lower Accotink | 74% |

Questions?

Chloride TMDL

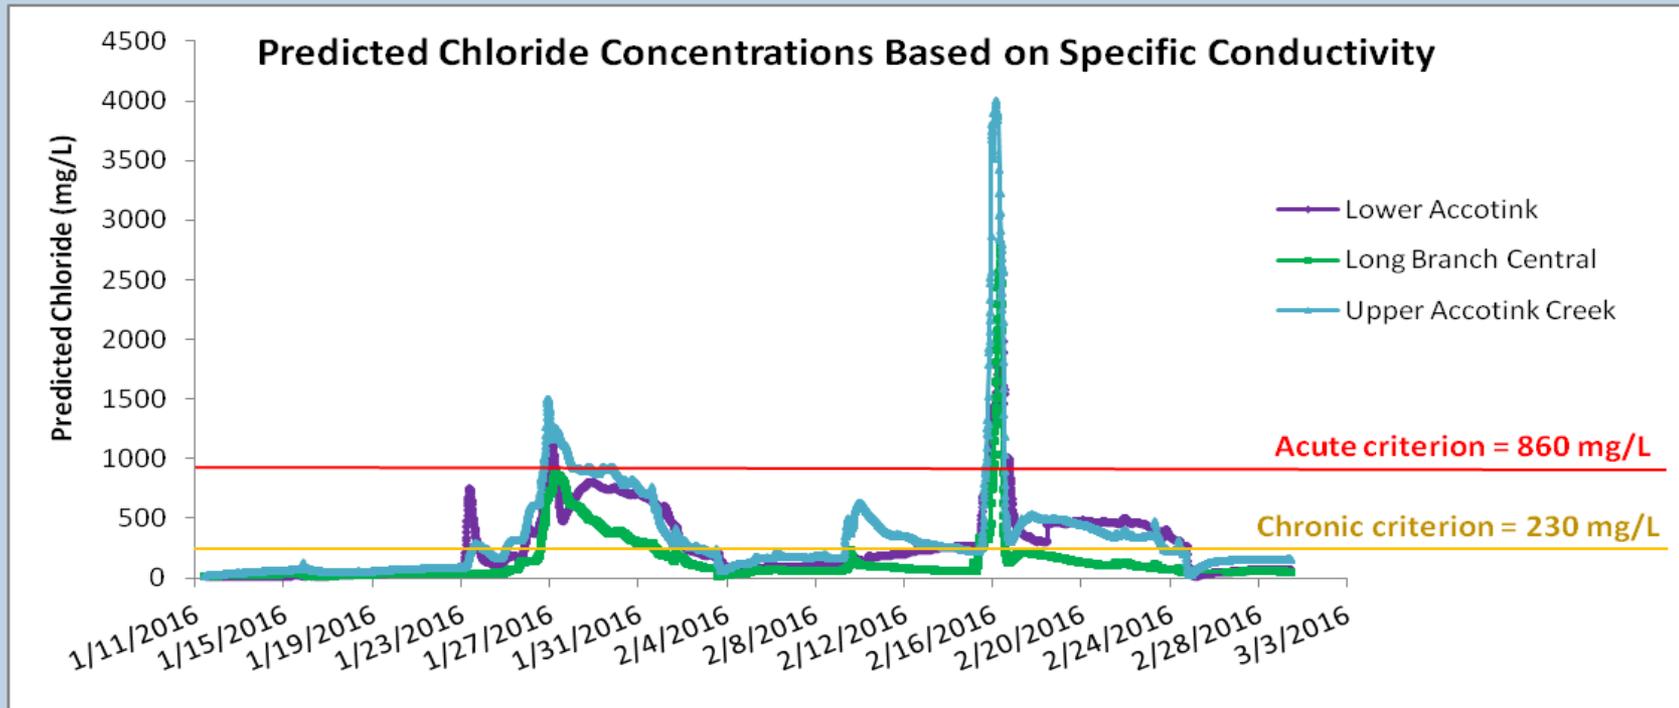

- Chloride Message
 - Public Safety will not be compromised by the implementation of this TMDL
 - The TMDL will be implemented through best management practices that include training and use of better technologies to more efficiently, safely and effectively apply chlorides.
 - This form of implementation will improve water quality while saving costs and maintaining public safety
- Evaluation of approaches
 - Flow * Standard (230 mg/L Chloride)
 - Simple equation
 - More emphasis on Maximum Daily Load
 - HSPF Model
 - The model is a tool
 - Data rich watershed – allows for good calibration
 - Instream processes and mixing considered

Analysis of Monitoring Data

- Continuous Specific Conductance monitoring
- Chloride grab samples
- Regression model relating Cl concentration to specific conductance
- Use regression model to estimate daily/hourly Cl concentrations

Estimated Chloride Concentrations

Reductions Required to Meet Criteria, Based on Estimated Chloride Concentrations

| Location | Reduction for Acute Criterion | Reduction for Chronic Criterion | Period (number of days) |
|---------------|-------------------------------|---------------------------------|---------------------------------|
| Ranger Road* | 73% | 87% | 11/19/11-1/8/15 (1,027 days) |
| Braddock Rd. | 75% | 82% | 2/5/15- (147 days) |
| Telegraph Rd. | 23% | 64% | 1/11/16-2/29/16 (50 days) |
| Long Br. | 69% | 72% | 4/17/13- (1,138 days) |

* Based on Braddock Rd. regression

Steps in Estimating Application Rate (lbs Cl/ac/snow event)

| Number | Step | Source of Information |
|--------|--|---|
| 1 | Assemble deicers (bought, used) per year | VDOT, Vienna, Fairfax Co. |
| 2 | Estimate Cl per deicer | VDOT |
| 3 | Estimate applied area | CBP impervious roads |
| 4 | Estimate number of snow events | Model meteorology; Reagan airport snow readings |

1. Application Criteria: 0.05 in water equivalent as snow
2. 75% road rate applied to parking lots, driveways, sidewalks in commercial, industrial, and high density residential land
3. Application rates weighed by primary, secondary, and local road miles
 - Higher weight to segments with higher percentage of primary and secondary roads

Calibration of Mass Balance

Division of Application Rate

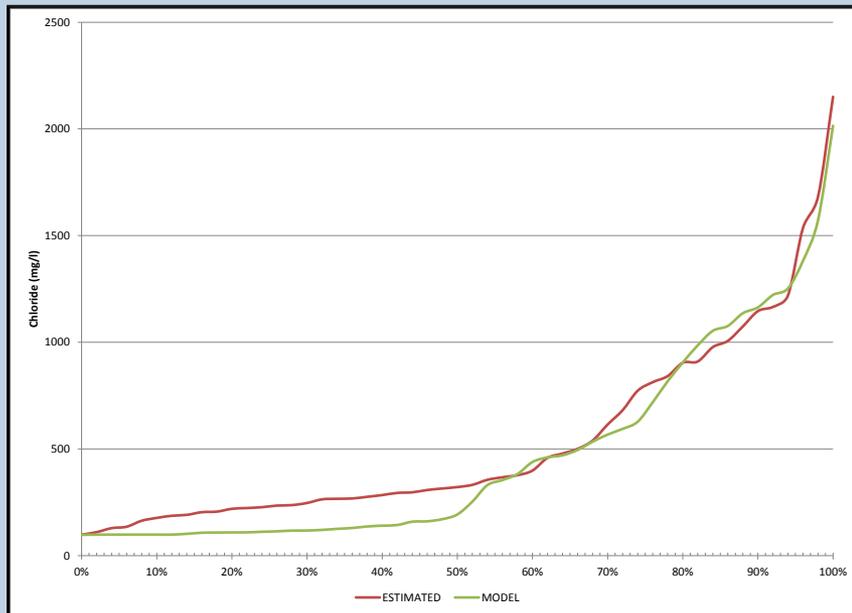

- 60% of application rate on impervious
- 15% of application rate on pervious
- 25% not accounted for
 - Deep ground water
 - Uncertainty in estimates

Percent of Estimated Cl Load

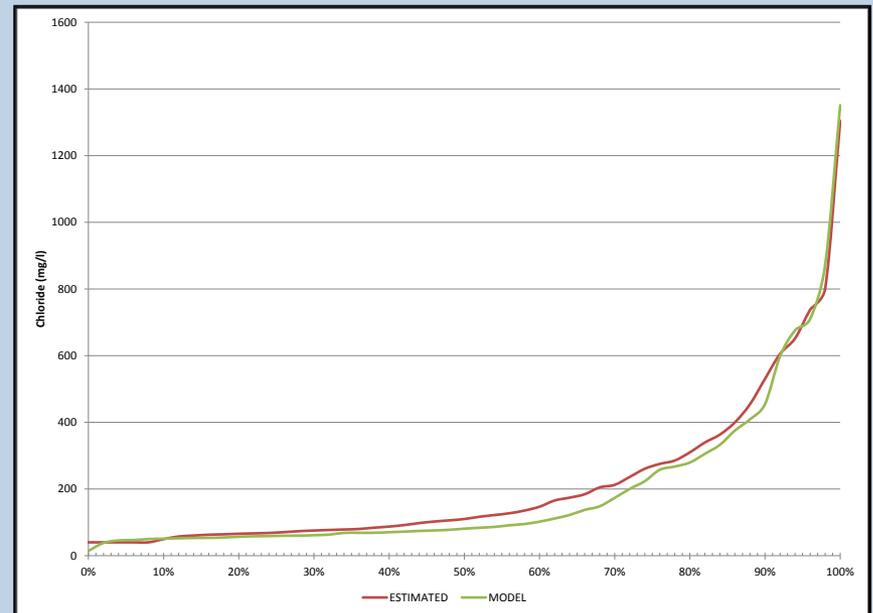

| Watershed | Percent Load |
|---------------|--------------|
| Ranger Road | 107 % |
| Long Branch | 109 % |
| Braddock Road | 96 % |

Calibrated to Cumulative Frequency Distribution of Estimated Chloride Concentrations

Upper Accotink

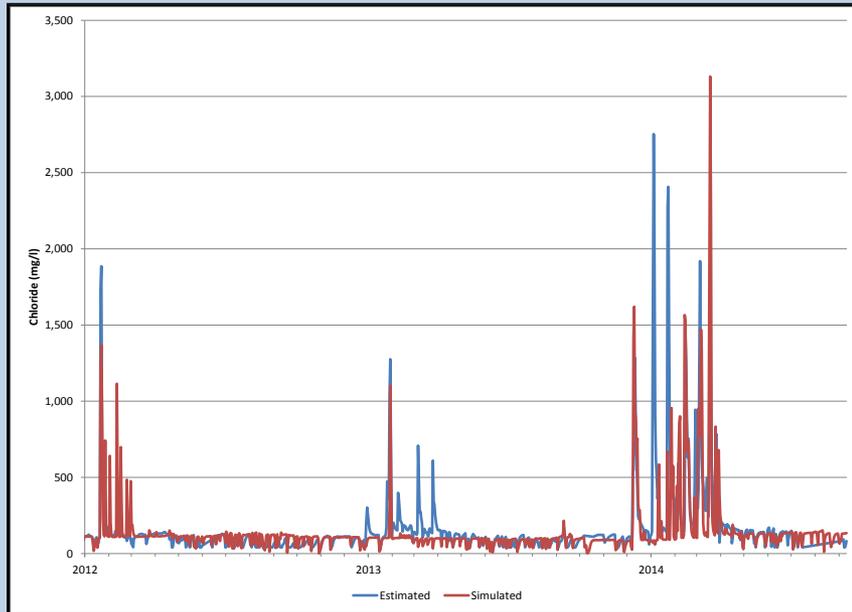

Long Branch

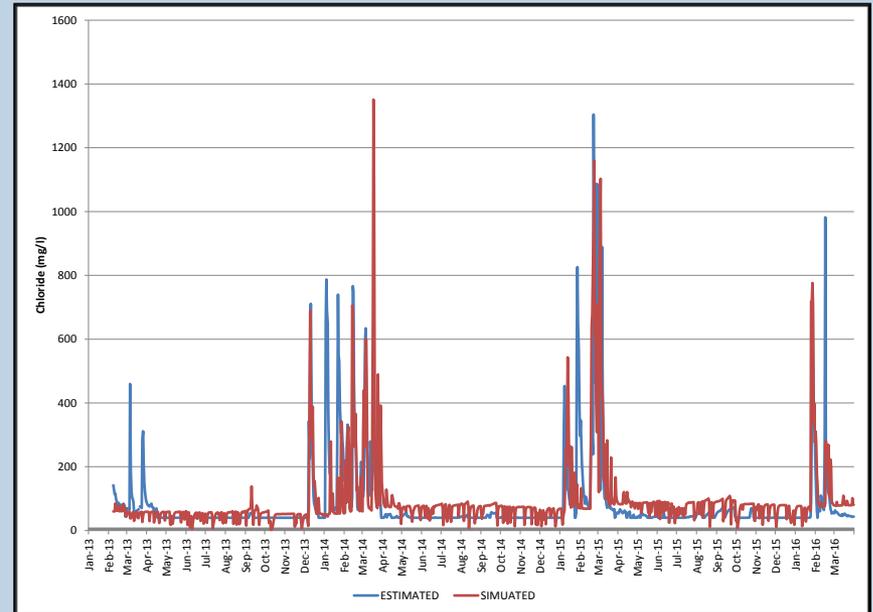

Time Series of Estimated and Modeled Chloride Concentrations

Upper Accotink

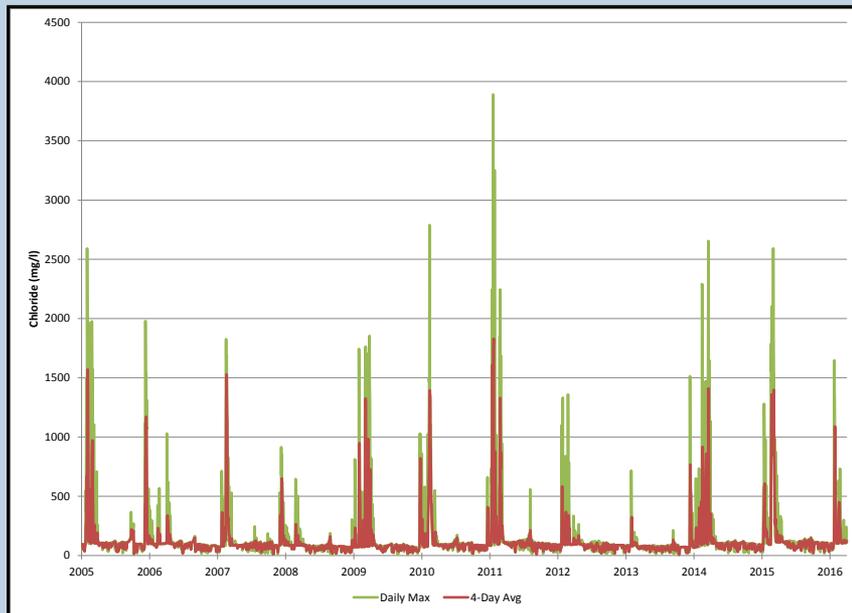

Long Branch

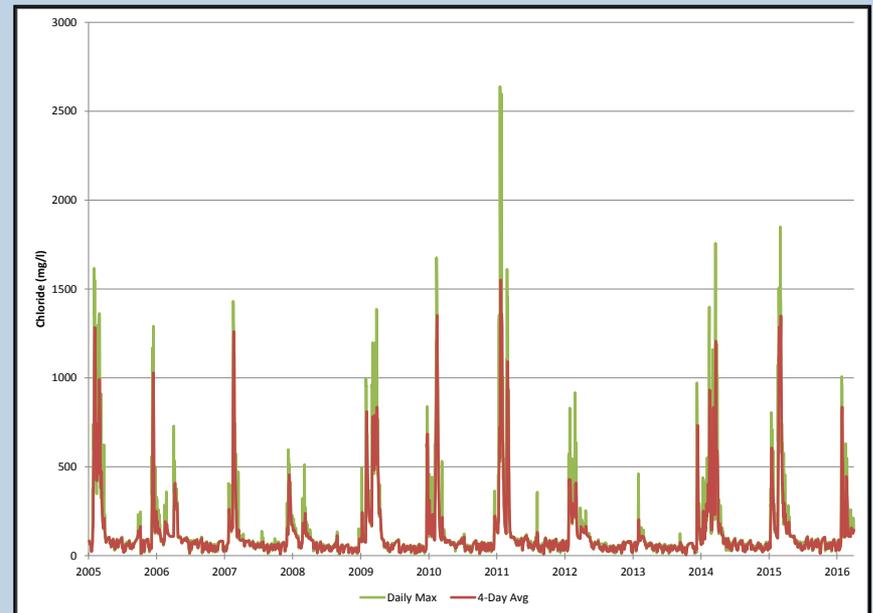

Simulated Maximum Daily and Four-Day Average Chloride Concentrations

Upper Accotink

Lower Accotink

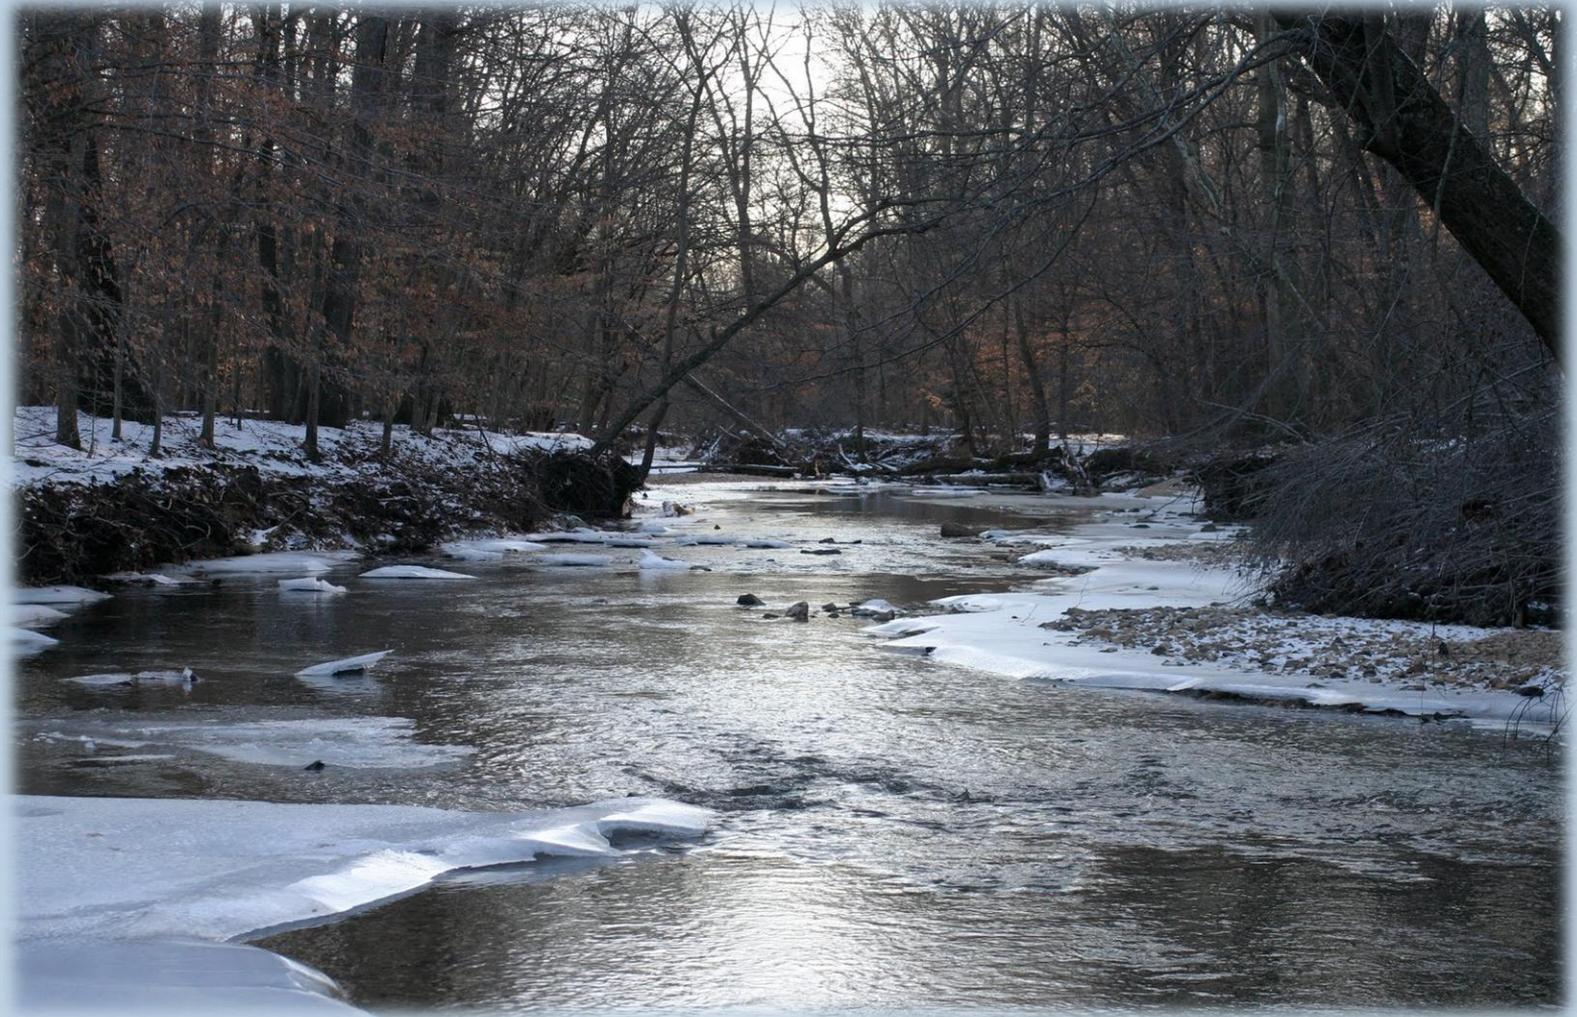

Long Branch simulation results not shown.

Estimated Required Reductions

| Impairment | Model: 2006-2016 | Model: 2012-2016 | Estimated Chloride Concentrations ¹ |
|----------------------|---------------------|---------------------|--|
| Upper Accotink Creek | 84% | 86% | 82% |
| Lower Accotink Creek | 80% | 83% | 64% |
| Long Branch | 70% | 71% | 72% |

¹ Based on Specific Conductance and Chloride Regression Relationships.

Questions?

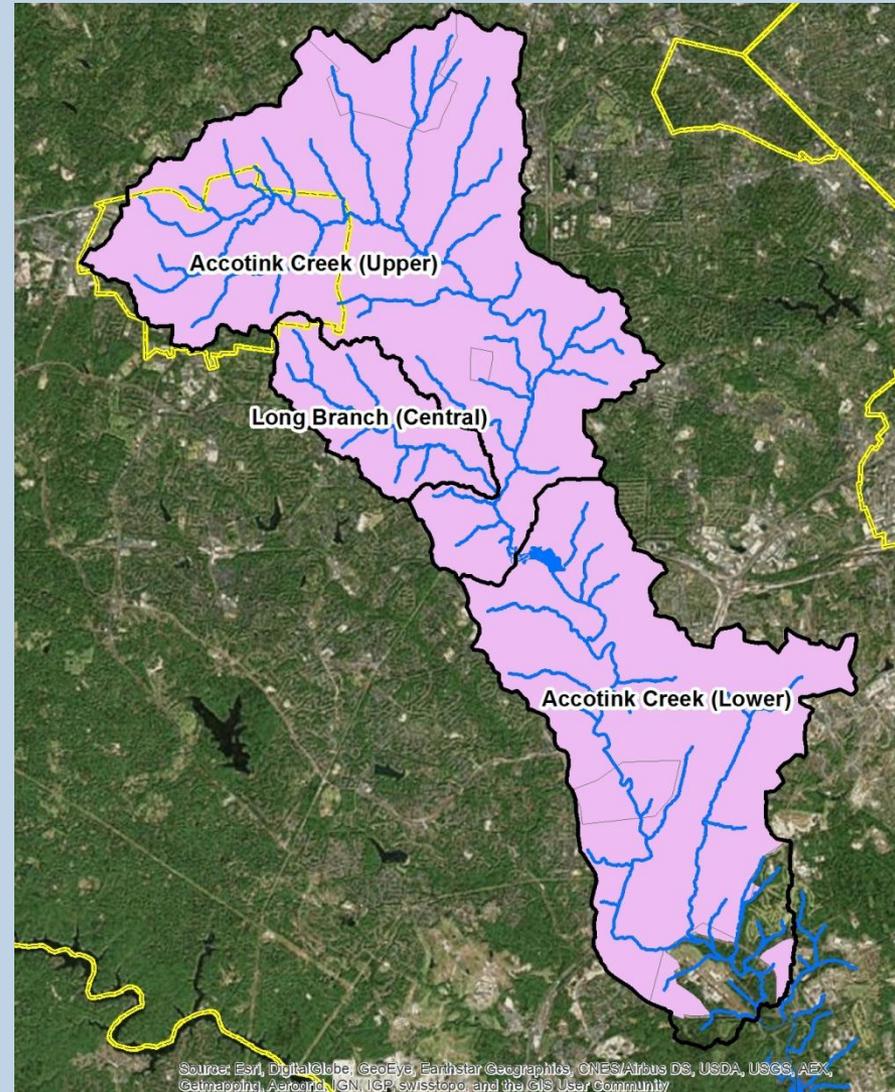

Allocations

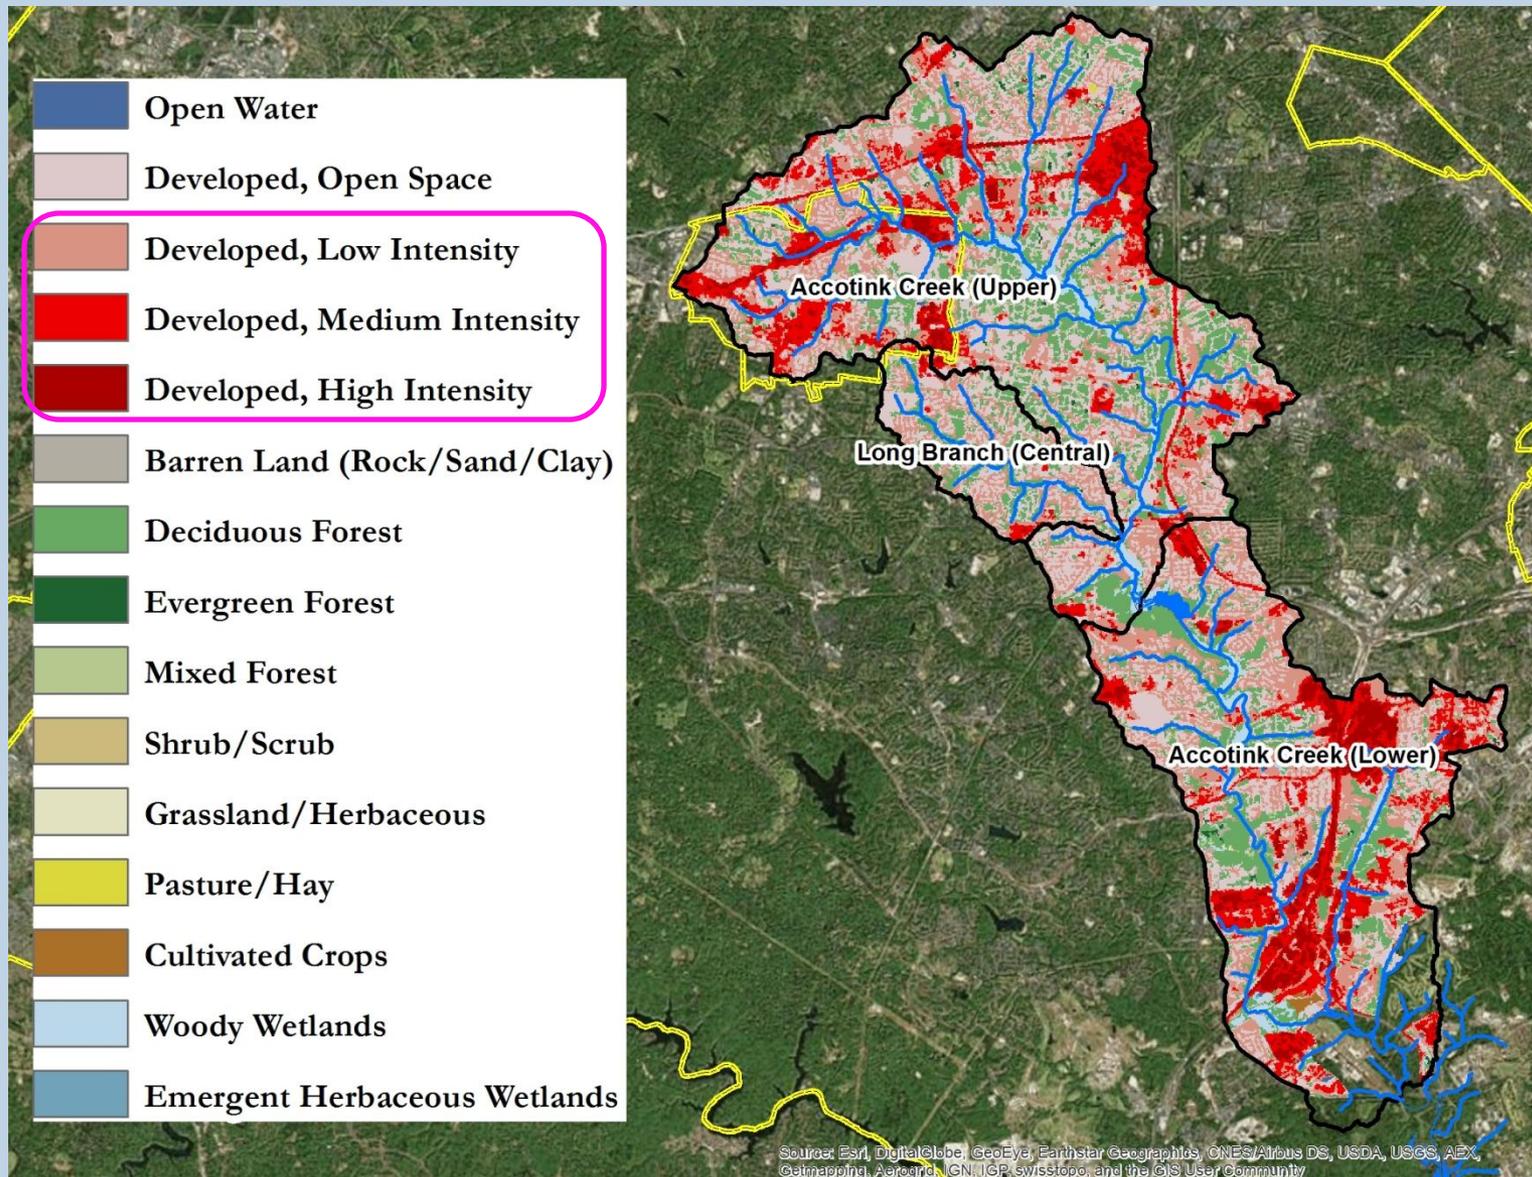

- $TMDL = WLA + LA + MOS$
- $MOS = 10\%$ of the TMDL
- Next step is to determine the WLA
 - Decision point – MS4 WLAs

MS4 Wasteload Allocations

- WLA ← MS4 service area within...
 - Phase I: the entire county
 - Phase II: the Census Urbanized Area
- Deriving the MS4 Wasteload Allocation, 2 options:
 - Using actual delineated service area
 - Using surrogate land uses within the Census Urbanized Area

Accotink Creek Watershed Land Uses

MS4 Wasteload Allocations

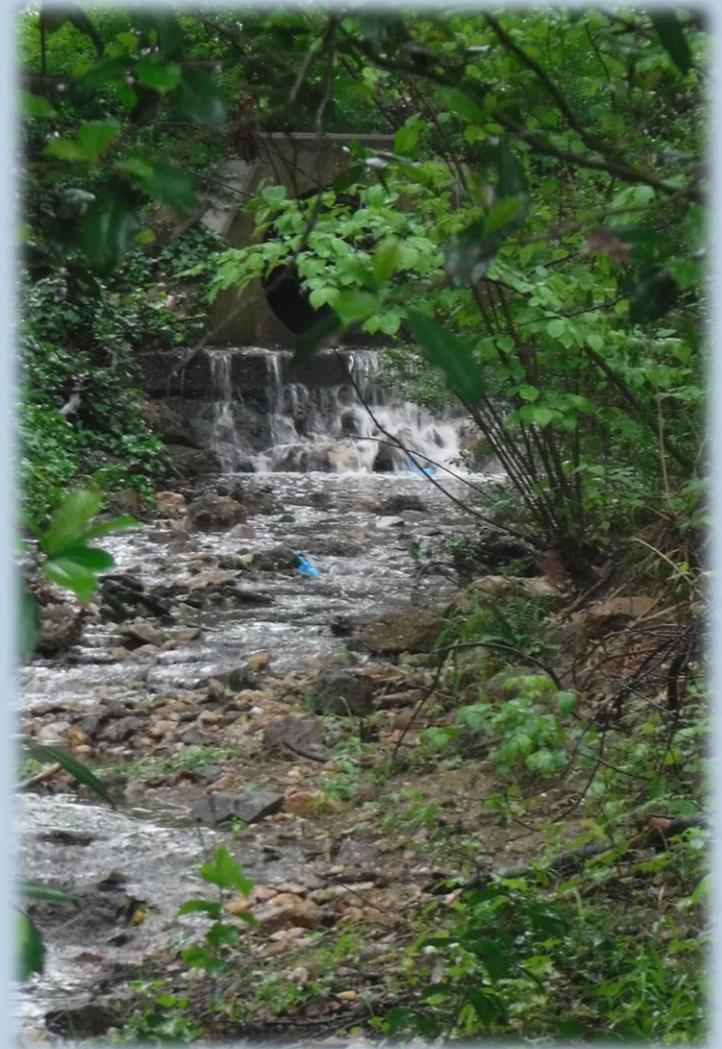

- MS4s are connected systems
- WLA aggregation – By Municipality
 - Municipalities: Fairfax County, Fairfax City, & Town of Vienna
 - Included: Municipality, VDOT, Public Schools, NVCC, Ft. Belvoir, and GMU

Example from 2008 Lower Accotink Creek Bacteria TMDL

| Table 5-1: MS4 Wasteload Allocation for <i>E. coli</i> | | |
|--|-------------------------------------|---------------------------------|
| Permit Number | MS4 Permit Holder | Wasteload Allocation (cfu/year) |
| VA0088587 | Fairfax County | 1.73E+12 |
| VAR040062 | VDOT | |
| VAR040104 | Fairfax County Public Schools | |
| VAR040095 | Northern Virginia Community College | |
| VAR040093 | Fort Belvoir | |

Next Steps

- Finalize the allocations (WLA & LA)
 - MS4 dependent
- Draft the report
- Bring draft TMDL report to TAC
 - Last opportunity for advisory role
- Bring draft TMDL report to public

Revised Timeline
